ASSEMBLY INSTRUCTION

Square Tank, polished aluminium
for C.O.E. cabs

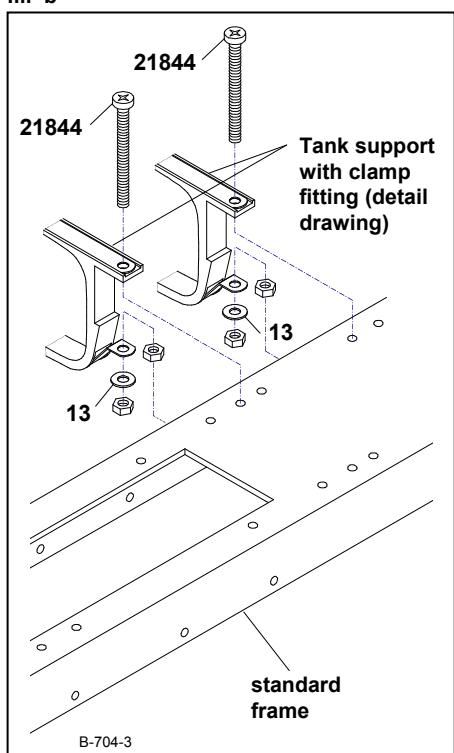

Art.-No. 729-W

ill. a

ill. b

This square tank has to be fixed to the frame at exactly **the same fixing points** as for the standard **round tank** (please refer to the assembly instructions of your chassis kit). The following drawings serve as examples: **Main drawing** shows the attachment to the right-hand side on a professional chassis Art.-No. 730/731; **illustr. b** indicates the attachment to a standard chassis Art.-No. 357/360. The attachment to the left-hand side as well as to other chassis types has to be executed in the same sense.

➔ **NOTE:** When attaching to a **professional frame (ill. a)** the type of fixing changes as follows:

- a. **"Attachment to the crosshead":** As the tank support has to sit close to the frame, take off one of the two screws M2.
- b. **"Attachment to the mounting angle 1 (plastic)":** The mounting angle will not be used on the professional frame. The second fixing point is variable.
- c. **"Attachment to the mounting angle 2 (aluminium)":** Attachment to the screws of the mounting angle remains unchanged.

First mount each of the straight ends of the clamp fittings **20124** along with the tank supports **27404** to the left- or right-hand side of the frame; for this purpose use screws **21844** and nuts M3.

Press the rods **31946** into the bushings of one tank cover **27409**, and slide then the tank cover into the tank tube **27397**; afterwards press the second tank cover onto the pins and into the tank tube. Now set the tank into the tank supports. Lay the long ends of the tank supports and the clamp fittings around the tank tube and fix the clamp fittings from underneath to screws **21844** using washers **20046** and nuts M3.

Finally press the tank lock **27402** into the opening of the tank tube.
